**Abstract:** This session is dedicated to problems in inventory control, production planning and scheduling. The unifying theme is nonstationarity. We focus on problems that feature stochastic nonstationary random variables, such as demand, production rate, and lead times. We welcome contributions tackling theoretical as well as applied challenges; including, but not limited to, single and multi-product settings, joint replenishment, lateral transshipment, inventory routing, forecasting, and demand correlation.

*Keywords:* Inventory control, production planning and scheduling; Operations Research; Optimization and Control
